(U) ~~(S/REL TO USA AND MCFI)~~ **CEXC Analysis of Mosul Attack:** The seat of the explosion was in a seating area opposite the main serving area. The seat of the explosion, blast pattern, and fragmentation effect was not consistent with that of rocket, mortar or ground placed IED. The ground effect on the concrete floor was shallow and omni directional. The fragmentation traveling forward towards the serving area completely penetrated several metal kitchen appliances. The surrounding area was littered with blast damaged tables and chairs, consistent with a high explosive event. Two chairs were recovered in close proximity to the seat of the explosion, which had sustained extensive buckling to the leg support area

(U) ~~(S/REL TO USA AND MCFI)~~ Individual body parts such as skull fragments, an ear, eye lid, and other small unidentified parts were evenly spread throughout the blast areas. Small body parts were found in external areas including the roof section. A large number of the body parts were fused to a material that has been identified as the standard uniform for Iraqi National Guard (ING) and Iraqi Regular Army (IRA) personnel. One section of the Chocolate Chip pattern material was recovered with the designation label still attached. This has been initially associated with IRA issued uniforms, and is an investigation line CID are following up. Sections of a canvas type material were found in key areas, mainly where the blast pattern was identified.

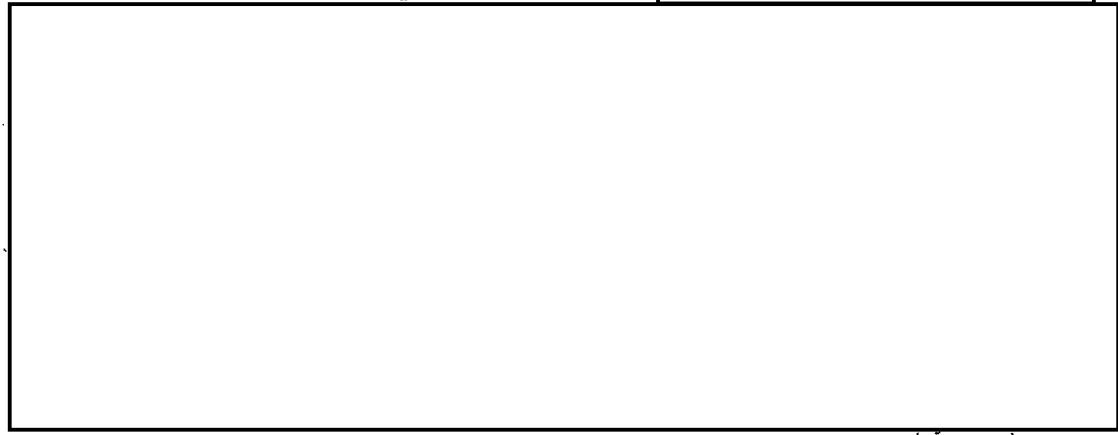

(U) ~~(S//REL TO USA AND MCFI)~~ [Redacted]

(U) ~~(S//REL TO USA AND MCFI)~~ A piece of black single core wire and a small-coiled spring was found. Comparison to previously recovered switches is required before further assessment takes place.

(U) ~~(S//REL TO USA AND MCFI)~~ Physical scene analysis in relation to blast and fragmentation damage would indicate that the explosive event that took place in the DFAC was consistent to that expected from an IED. [Redacted]
